

## Compulsory Task 1

Follow these steps:

- Create a Python file called **full\_name.py** in this folder.

This program will be used to validate that a user inputs at least two names when asked to enter their full name.

- Ask the user to input their full name.
- Perform some validation to check that the user has entered a **full** name. Give an appropriate error message if they haven't. One of the following messages should be displayed based on the user's input:
  - "You haven't entered anything. Please enter your full name."
  - "You have entered less than 4 characters. Please make sure that you have entered your name and surname."
  - "You have entered more than 25 characters. Please make sure that you have only entered your full name."
  - "Thank you for entering your name."

The error message examples should help you to determine the sorts of checks your program will need to perform on the data that the user provides.
